AND ORIGINAL DETECTION METHOD****(57) Abstract:**

PROBLEM TO BE SOLVED: To provide the image reader that detects an original independently of a density of an original image and to provide the original retaining sheet and the original detection method.

SOLUTION: A white-black repetitive pattern in a main scanning direction as shown in Figure (a) is applied to an original side of an original retaining sheet 2. When an original 1 comes across a position of the original retaining sheet 2, an output waveform of a sensor changes from a waveform corresponding to the pattern of the original retaining sheet 2 into a waveform corresponding to an image of the original 1 as shown in Figure (b), then the presence of the original is sensed through this change.

(54) IMAGE READER

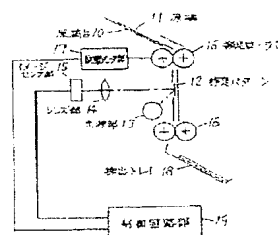

(57) Abstract:

PURPOSE: To simplify and miniaturize the constitution of the titled reader by detecting the presence/absence, head end, and tail end of an original with a reading position sensor.

CONSTITUTION: The original 11 is placed on an original platen 10, and an image sensor 15 reads a special pattern 12 to confirm the presence/absence of the original. Thereafter, the driving 17 of a roller 16 is controlled 19 to sequentially convey the originals 11. An original 11 is continuously conveyed until the image sensor 15 reads a pattern different from the specific pattern. After the time of reading the said pattern, the image sensor 15 reads image information from each scanning line while the original 11 is conveyed stepwise. At a time when the image sensor 15 reads the special pattern again as image information, the tail end of the original 11 is detected and the reading action is ended. Thereafter, the original 11 is conveyed continuously again by the roller 16, and exhausted to a tray 18. With such constitution, a conventionally needed reading position sensor for detecting the position of an original is made unnecessary, hence the coZ:14: lens part, 13: light source part, 16: carrying roller part,

19: control circuit part, 17: driving motor part, 18: exhausting tray.

(57) Abstract:

COPYRIGHT: (C)1997,JPO

PROBLEM TO BE SOLVED: To provide an original reader with which information on the top and rear end of an original and an original size, etc., can be easily obtained without mounting plural sensors.

SOLUTION: At an original reading position 1Aa, a reference reflector 21 for correction provided with a reference reflection plane 21a for shading correction is mounted through an original feeding path 1A while being confronted to an optical system 5B and on the reference reflection plane 21a of this reference reflector 21 for correction, stripe patterns with an area wider than the width of the original as an object or discontinuous patterns K based on this area are formed. Then, a form information processing part 9 for inputting the prescribed information outputted from an original reading part 5 and calculating output timing information of the passage of the top end edge and rear end edge of the original and the form width information of the original based on different reflection information from the reference reflection plane 21a caused by the presence/absence of the original is provided together at
